Beautiful work let's finish create the content from the previous conversation.

Sons comment.
That's effectively pointing at the right thing. The levels are primitives, patterns, principles, paradigms, emergence, ethics, existence. GCO is a global closure operator or fixed point. I'm keeping the actual primitives abstracted for now. Something I'm grappling with is without constraints, they can be used to effectively construct a reality for a group of people, and they suggest ethics must be an emergent step in the process for meaning and coherent existence, but current ethical theory treats ethics as a social construct that is optional and negotiable. I think these have to be handled with care to prevent manipulation. In my testing, every AI model can use the primitives natively and seamlessly, which reduces the friction between idea and implementation significantly. I'm proposing a baseline set of Relational Rights that must accompany the primitives. Because I've demonstrated that using the primitives can be used to create new programming paradigms, new definitions of pretty much any word, etc.
